

What We Actually Built

Evidently is an AI-powered resume screening platform that turns black-box scoring into an explainable, evidence-backed decision process. This document outlines the working proof of concept delivered for this hackathon.

SCOPE OF THIS POC

A complete, working platform covering the full expected outcome: bulk resume upload, AI-based scoring, skill gap analysis, resume summaries, AI-generated interview questions, and a candidate ranking dashboard — built end-to-end, not mocked or scripted.

LIVE AND WORKING RIGHT NOW

- Bulk Upload Pipeline**
Multiple resumes processed at once with real-time async status tracking, from parsing through scoring.
- Semantic AI Scoring**
Vector embedding-based matching per requirement, not keyword search or a single blended guess.
- Evidence-Linked Results**
Every score traces back to the exact resume line that earned it — click to verify, nothing is a black box.
- Three-Tier Skill Gaps**
Every requirement is marked missing, partially evidenced, or claimed-but-unproven.
- Grounded Interview Questions**
Generated from each candidate's actual gaps, with the AI's reasoning shown alongside each question.
- Prompt Injection Defense**
Detects hidden or adversarial instructions embedded in resume text, tested against real injection samples.
- Blind Screening Mode**
Names and colleges are masked, with anonymization enforced at the scoring layer, not just the display layer.
- Ranking Dashboard**
All candidates for a role, sortable and filterable by score and gap status, in one view.

WHAT THIS PROVES

The core idea works end-to-end, on real resumes and real job descriptions, not just on paper. Every differentiator claimed here — explainability, security, and fairness — is something that can be clicked and verified live in the deployed application, not a slide describing a plan.
